South River Technologies Releases WebDrive v6.0

Annapolis, MD - February 3, 2004 - South River Technologies, a leading developer of Internet Utilities for file transfer and collaboration, announced today the release of version 6.0 of their WebDrive product. WebDrive enables users to connect to different types of servers over the Internet through a drive letter on their computer.

The new version adds support for SFTP, an FTP-like protocol that offers both increased performance and security. WebDrive also supports WebDAV, FTP, and Microsoft FrontPage Extensions. A user can connect securely to multiple servers using WebDrive by simply creating different drive letters for each server.

"The addition of this protocol advances our goal of building a multi-protocol connection point to files on many types of servers," said John Glavin, Co-founder and VP of Engineering for South River Technologies. "And having this connection point through a drive letter gives users the familiar file access interface of Windows - they don't have to know about protocols and server types."

About South River Technologies

Founded in 1996, South River Technologies develops file management software which is used for file collaboration, shared access and website management. All SRT products include strong security to provide encrypted data transfer. This unique client technology, commercially available as WebDrive®, integrates into the Windows environment, creating an instantly familiar interface for the end user, reducing training and support costs. This technology is also licensed to independent software vendors to add functionality to existing product suites. ISPs can also license re-branded versions of our products as an add-on to their service offerings.
